

P. 2.2 :- A certain corner of a room is selected as the origin of a rectangular coordinate system. If an insect is crawling on an adjacent wall at a point having coordinates $(2, 1)$ where the units are in metres, what is distance of the insect from this corner of the room?

Solution :-

Corner of the room is selected as the origin of rectangular co-ordinate system.

The insect is at point $P(2, 1)$

The position vector of insect is

$$\vec{r} = 2\hat{i} + \hat{j} \text{ meters.}$$

Distance of the insect from corner of the room $= r = ?$

As we have magnitude

of the position vector $\vec{r} = x\hat{i} + y\hat{j}$ is

$$r = \sqrt{x^2 + y^2}$$

$$r = \sqrt{(2)^2 + (1)^2} \text{ meters}$$

$$r = \sqrt{5} = 2.24 \text{ m} \quad \text{Answer.}$$

P. 2.3 :- What is the unit vector in the direction of the vector $\vec{A} = 4\hat{i} + 3\hat{j}$?

Solution :- The given vector is

$$\vec{A} = 4\hat{i} + 3\hat{j}$$

$$\text{Unit vector } = \hat{A} = ?$$

As we have a formula

$$\hat{A} = \frac{\vec{A}}{|\vec{A}|} \hat{A}$$

or

$$\hat{A} = \frac{\vec{A}}{|\vec{A}|} \quad \text{--- (1)}$$

$$\begin{aligned} \text{The magnitude of vector } \vec{A} &= |\vec{A}| = \sqrt{A_x^2 + A_y^2} \\ &= \sqrt{(4)^2 + (3)^2} \end{aligned}$$

Putting values of \vec{A} and $|\vec{A}|$ in eq (1) we get

$$\hat{A} = \frac{4\hat{i} + 3\hat{j}}{5} \quad \text{Answer.}$$

2.4 :- Two particles are located at $\vec{r}_1 = 3\hat{i} + 7\hat{j}$ and $\vec{r}_2 = -2\hat{i} + 3\hat{j}$ respectively. Find both the magnitudes of the vector and its orientation w.r.t. x-axis.

Solution :- As

$$\vec{r}_1 = 3\hat{i} + 7\hat{j}$$

$$\vec{r}_2 = -2\hat{i} + 3\hat{j}$$

Magnitude of vector $\vec{r} = ?$

Its orientation w.r.t x-axis (coordinates)

The vector $\vec{r} = \vec{r}_2 - \vec{r}_1$

$$= (-2\hat{i} + 3\hat{j}) - (3\hat{i} + 7\hat{j})$$

$$= -2\hat{i} - 3\hat{i} + 3\hat{j} - 7\hat{j}$$

$$\vec{r} = -5\hat{i} - 4\hat{j}$$

The magnitude of vector \vec{r} can be determined by the formula

$$|\vec{r}| = r = \sqrt{x^2 + y^2}$$

$$\text{Here } x = -5 \text{ and } y = -4$$

$$\therefore r = \sqrt{(-5)^2 + (-4)^2}$$

$$= \sqrt{25 + 16}$$

$$\boxed{r = 6.4}$$

Answer

Now Orientation of vector \vec{r} w.r.t x-axis will be its coordinates.

$$\text{As } \vec{r} = -5\hat{i} - 4\hat{j}$$

\therefore Orientation is $(-5, -4)$ with respect to x-axis

Answer

P. 2.5 :- If a vector \vec{B} is added to vector \vec{A} , the result is $6\hat{i} + \hat{j}$. If \vec{B} is subtracted from \vec{A} , the result is $-4\hat{i} + 7\hat{j}$. What is the magnitude of \vec{A} ?

Solution :- As given

$$\vec{A} + \vec{B} = 6\hat{i} + \hat{j} \quad \text{①}$$

$$\vec{A} - \vec{B} = -4\hat{i} + 7\hat{j} \quad \text{②}$$

$$|\vec{A}| = ?$$

Adding eq ① and ②

$$(\vec{A} + \vec{B}) + (\vec{A} - \vec{B}) = (6\hat{i} + \hat{j}) + (-4\hat{i} + 7\hat{j})$$

$$2\vec{A} = 2\hat{i} + 8\hat{j}$$

$$\vec{A} = \frac{2}{2} \hat{i} + \frac{8}{2} \hat{j} = \hat{i} + 4\hat{j}$$

The magnitude of $\vec{A} = |\vec{A}| = \sqrt{A_x^2 + A_y^2}$
 $A = \sqrt{(1)^2 + (4)^2} = \sqrt{17}$.

$A = 4.1$

 Answer.

P. 2.6 :- Given that $\vec{A} = 2\hat{i} + 3\hat{j}$ and $\vec{B} = 3\hat{i} - 4\hat{j}$
 find the magnitude and direction of

(a) $\vec{C} = \vec{A} + \vec{B}$ and (b) $\vec{D} = 3\vec{A} - 2\vec{B}$

Solution :- We have

$$\begin{aligned}\vec{A} &= 2\hat{i} + 3\hat{j} \\ \vec{B} &= 3\hat{i} - 4\hat{j} \\ \vec{C} &= \vec{A} + \vec{B} \\ &= (2\hat{i} + 3\hat{j}) + (3\hat{i} - 4\hat{j}) \\ \vec{C} &= 5\hat{i} - \hat{j}\end{aligned}$$

The magnitude

$$|\vec{C}| = \sqrt{(5)^2 + (-1)^2} = \sqrt{25+1}$$

Direction $|\vec{C}| = 5.09$ Answer

As $\hat{C} = \frac{\vec{C}}{|\vec{C}|}$

and

$$\hat{C} = \frac{\vec{C}}{|\vec{C}|}$$

$\hat{C} = \frac{5\hat{i} - \hat{j}}{5.09}$

 Answer.

(b) $\vec{D} = 3\vec{A} - 2\vec{B}$

Putting values of \vec{A} and \vec{B}

$$\begin{aligned}\vec{D} &= 3(2\hat{i} + 3\hat{j}) - 2(3\hat{i} - 4\hat{j}) \\ &= 6\hat{i} + 9\hat{j} - 6\hat{i} + 8\hat{j} \\ \vec{D} &= 17\hat{j}\end{aligned}$$

Magnitude

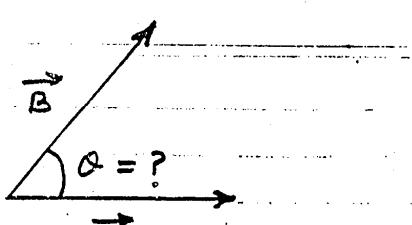

$$|\vec{D}| = \sqrt{(0)^2 + (17)^2} = 17$$

$|\vec{D}| = 17$

Direction

$$\begin{aligned}\hat{D} &= \frac{\vec{D}}{|\vec{D}|} = \frac{17\hat{j}}{17} = \hat{j}\end{aligned}$$

2.7 :- Find the angle between the two vectors $\vec{A} = 5\hat{i} + \hat{j}$
and $\vec{B} = 2\hat{i} + 4\hat{j}$.

Solution:- $\vec{A} = 5\hat{i} + \hat{j}$ 
 $\vec{B} = 2\hat{i} + 4\hat{j}$
 $\alpha = ?$

As we know that

$$\vec{A} \cdot \vec{B} = AB \cos \alpha \quad \text{--- (1)}$$

$$\text{and } \vec{A} \cdot \vec{B} = A_x B_x + A_y B_y + A_z B_z \quad \text{--- (2)}$$

By comparing eq (1) and (2)

$$AB \cos \alpha = A_x B_x + A_y B_y + A_z B_z$$

$$\cos \alpha = \frac{A_x B_x + A_y B_y + A_z B_z}{AB} \quad \text{--- (3)}$$

As $\vec{A} = 5\hat{i} + \hat{j} \Rightarrow A_x = 5, A_y = 1, A_z = 0$

and $|\vec{A}| = \sqrt{(5)^2 + (1)^2} = \sqrt{26} = 5.09$

Also

$$\vec{B} = 2\hat{i} + 4\hat{j} \Rightarrow B_x = 2, B_y = 4, B_z = 0$$

and $|\vec{B}| = \sqrt{(2)^2 + (4)^2} = \sqrt{4+16} = \sqrt{20} = 4.47$

Putting above values in eq (3) we get

$$\cos \alpha = \frac{(5)(2) + (1)(4) + 0}{(5.09)(4.47)} = \frac{10+4}{(5.09)(4.47)}$$

$$\cos \alpha = \frac{14}{22.75}$$

$$\alpha = \cos^{-1}(0.615)$$

$\alpha = 52^\circ$	Answer
---------------------	--------

P. 2.8 :- Find the work done when the point of application of the force $3\hat{i} + 2\hat{j}$ moves in a straight line from the pt. $(2, -1)$ to the pt. $(6, 4)$.

Solution:- $\vec{F} = 3\hat{i} + 2\hat{j}$

$$\text{Point A } (2, -1) \Rightarrow \vec{r}_A = 2\hat{i} - \hat{j}$$

$$\text{Point B } (6, 4) \Rightarrow \vec{r}_B = 6\hat{i} + 4\hat{j}$$

then vector \vec{r} between these two points will be

$$\begin{aligned}\vec{r} &= \vec{r}_B - \vec{r}_A = (6\hat{i} + 4\hat{j}) - (2\hat{i} - \hat{j}) \\ &= 6\hat{i} + 4\hat{j} - 2\hat{i} + \hat{j} \\ \vec{r} &= 4\hat{i} + 5\hat{j}\end{aligned}$$

Thus work done $= \vec{F} \cdot \vec{r}$

$$\begin{aligned}&= (3\hat{i} + 2\hat{j}) \cdot (4\hat{i} + 5\hat{j}) \\ &= 3\hat{i} \cdot 4\hat{i} + 3\hat{i} \cdot 5\hat{j} + 2\hat{j} \cdot 4\hat{i} + 2\hat{j} \cdot 5\hat{j} \\ &= 12(\hat{i} \cdot \hat{i}) + 15(\hat{i} \cdot \hat{j}) + 8(\hat{j} \cdot \hat{i}) + 10(\hat{j} \cdot \hat{j}) \\ &= 12 + 10\end{aligned}$$

Work = 22 units. Answer.

P. 2.9 :- Show that the three vectors $\hat{i} + \hat{j} + \hat{k}$, $2\hat{i} - 3\hat{j} + 3\hat{k}$ and $4\hat{i} + \hat{j} - 5\hat{k}$ are mutually perpendicular.

Solution :- Let these three vectors are

$$\begin{aligned}\vec{A} &= \hat{i} + \hat{j} + \hat{k} \\ \vec{B} &= 2\hat{i} - 3\hat{j} + \hat{k} \\ \vec{C} &= 4\hat{i} + \hat{j} - 5\hat{k}\end{aligned}$$

When these three vectors are perpendicular then

$$\vec{A} \times \vec{B} = \vec{C}$$

This equation means, all the three vectors will be mutually perpendicular when the cross product of \vec{A} and \vec{B} is equal to \vec{C} .

$$\begin{aligned}\therefore \vec{A} \times \vec{B} &= (\hat{i} + \hat{j} + \hat{k}) \times (2\hat{i} - 3\hat{j} + \hat{k}) \\ &= \hat{i} \times (2\hat{i} - 3\hat{j} + \hat{k}) + \hat{j} \times (2\hat{i} - 3\hat{j} + \hat{k}) + \\ &\quad \hat{k} \times (2\hat{i} - 3\hat{j} + \hat{k}) \\ &= 2(\hat{i} \times \hat{i}) - 3(\hat{i} \times \hat{j}) + (\hat{i} \times \hat{k}) + 2(\hat{j} \times \hat{i}) - 3(\hat{j} \times \hat{j}) \\ &\quad + (\hat{j} \times \hat{k}) + 2(\hat{k} \times \hat{i}) - 3(\hat{k} \times \hat{j}) + (\hat{k} \times \hat{k})\end{aligned}$$

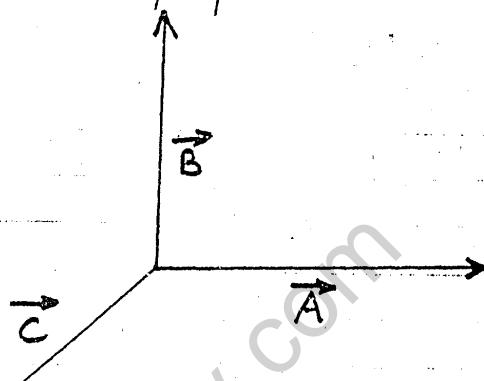

As we know that

$$\begin{array}{lcl} \hat{i} \times \hat{i} = \hat{j} \times \hat{j} = \hat{k} \times \hat{k} = \text{zero} \\ \hat{i} \times \hat{j} = \hat{k}, \quad \hat{j} \times \hat{i} = -\hat{k} \quad | \quad \hat{k} \times \hat{i} = \hat{j}, \quad \hat{i} \times \hat{k} = \hat{j} \\ \hat{j} \times \hat{k} = \hat{i}, \quad \hat{k} \times \hat{j} = -\hat{i} \end{array}$$

$$\text{So } \vec{A} \times \vec{B} = 2(0) - 3\hat{k} - \hat{j} - 2\hat{k} - 3(0) + \hat{i} + 2\hat{j} + 3\hat{i} + 0 \\ = 4\hat{i} + \hat{j} - 5\hat{k}$$

$$\vec{A} \times \vec{B} = \vec{C}$$

Hence these three vectors are perpendicular to each other

P- 2.10 :-

Given that $\vec{A} = \hat{i} - 2\hat{j} + 3\hat{k}$ and $\vec{B} = 3\hat{i} - 4\hat{k}$, find the length of the projection of \vec{A} on \vec{B} .

Solution :-

$$\vec{A} = \hat{i} - 2\hat{j} + 3\hat{k}$$

$$\text{and } \vec{B} = 3\hat{i} - 4\hat{k}$$

Projection of \vec{A} on $\vec{B} = A \cos \alpha = ?$

We have

$$\vec{A} \cdot \vec{B} = AB \cos \alpha$$

$$= B(A \cos \alpha)$$

$$\text{or } A \cos \alpha = \frac{\vec{A} \cdot \vec{B}}{B} = \frac{A_x B_x + A_y B_y + A_z B_z}{B} \quad \text{--- (1)}$$

$$\vec{B} = 3\hat{i} - 4\hat{k} \Rightarrow B_x = 3, B_y = 0, B_z = -4$$

$$|\vec{B}| = \sqrt{(3)^2 + (-4)^2} = \sqrt{25} = 5$$

Also

$$\vec{A} = \hat{i} - 2\hat{j} + 3\hat{k} \Rightarrow A_x = 1, A_y = -2, A_z = 3$$

Putting all the values in eq (1), we get

$$A \cos \alpha = \frac{(1)(3) + (-2)(0) + (3)(-4)}{5} = \frac{3 + 0 - 12}{5} = \frac{-9}{5}$$

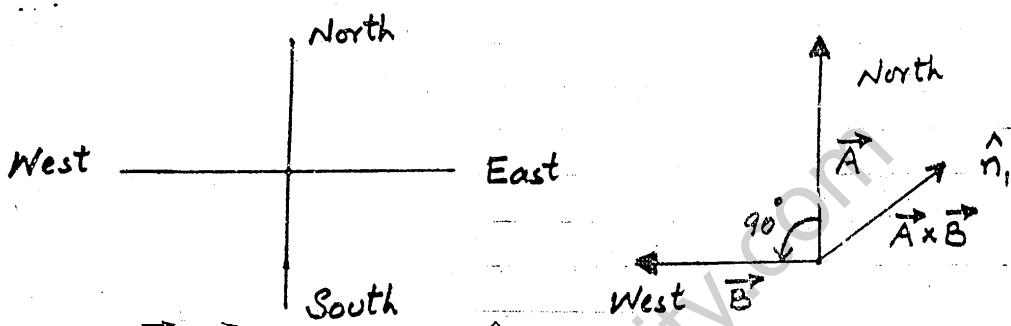

$A \cos \alpha = \frac{-9}{5} = \text{Projection of } \vec{A} \text{ on } \vec{B}$	Answer.
--	---------

P- 2.11 :- Vectors \vec{A} , \vec{B} and \vec{C} are 4 units north, 3 units west and 8 units east respectively.

Describe carefully

$$(a) - \vec{A} \times \vec{B} \quad (b) \vec{A} \times \vec{C} \quad (c) \vec{B} \times \vec{C}$$

Solution :-
 $\vec{A} = 4$ units north
 $\vec{B} = 3$ units west
 $\vec{C} = 8$ units east.

$$(a) - \vec{A} \times \vec{B} = AB \sin 90^\circ \hat{n}_1 \\ = (4)(3) \sin 90^\circ \hat{n}_1$$

$$\vec{A} \times \vec{B} = 12 \text{ units } \hat{n}_1$$

According to right hand rule, curl the fingers through the shorter angle i.e. from \vec{A} to \vec{B} , then thumb will be in vertically up ward.

$$\therefore \hat{n}_1 = \text{vertically up}$$

$$\text{So } \boxed{\vec{A} \times \vec{B} = 12 \text{ units vertically up}}$$

(b) -

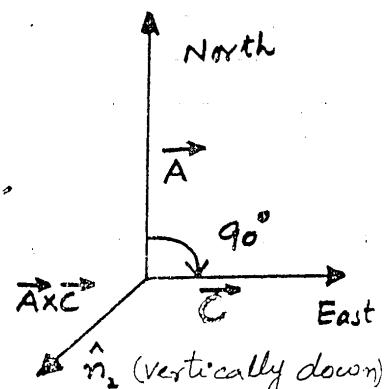

$$\vec{A} \times \vec{C} = AC \sin 90^\circ \hat{n}_2 \\ = (4)(8) \sin 90^\circ \hat{n}_2$$

$$\vec{A} \times \vec{C} = 32 \text{ units } \hat{n}_2$$

According to right hand rule,

$$\hat{n}_2 = \text{vertically down}$$

$$\therefore \boxed{\vec{A} \times \vec{C} = 32 \text{ units vertically down}}$$

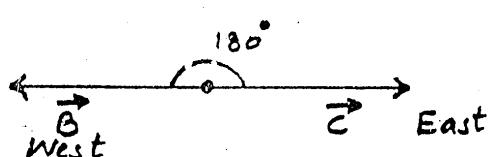

$$(c) - \vec{B} \times \vec{C} = BC \sin 180^\circ \hat{n}_3$$

$$\vec{B} \times \vec{C} = (3)(8) \sin 180^\circ \hat{n}_3$$

$$= (3)(8)(0) \hat{n}_3$$

$$\boxed{\vec{B} \times \vec{C} = 0}$$

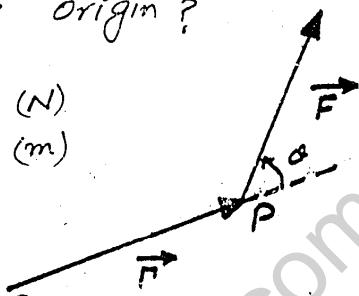

P. 2.12 :- The torque or turning effect of force about a given point is given by $\vec{\tau} \times \vec{F}$ where \vec{r} is the vector from the given point to the point of application of \vec{F} . Consider a force $\vec{F} = -3\hat{i} + \hat{j} + 5\hat{k}$ (newton) acting on the point $7\hat{i} + 3\hat{j} + \hat{k}$ (m). What is the torque in Nm about the origin?

Solution :-

$$\begin{aligned}\vec{F} &= -3\hat{i} + \hat{j} + 5\hat{k} \text{ (N)} \\ \vec{r} &= 7\hat{i} + 3\hat{j} + \hat{k} \text{ (m)}\end{aligned}$$

$$\vec{\tau} = \vec{r} \times \vec{F}$$

$$\begin{aligned}&= (7\hat{i} + 3\hat{j} + \hat{k}) \times (-3\hat{i} + \hat{j} + 5\hat{k}) \text{ (Nm)} \\ &= 7\hat{i} \times (-3\hat{i} + \hat{j} + 5\hat{k}) + 3\hat{j} \times (-3\hat{i} + \hat{j} + 5\hat{k}) + \hat{k} \times (-3\hat{i} + \hat{j} + 5\hat{k}).\end{aligned}$$

$$\begin{aligned}\vec{\tau} &= -21(\hat{i} \times \hat{i}) + 7(\hat{i} \times \hat{j}) + 35(\hat{i} \times \hat{k}) - 9(\hat{j} \times \hat{i}) + 3(\hat{j} \times \hat{j}) \\ &\quad + 15(\hat{j} \times \hat{k}) - 3(\hat{k} \times \hat{i}) + (\hat{k} \times \hat{j}) + 5(\hat{k} \times \hat{k}).\end{aligned}$$

As we know that

$$\hat{i} \times \hat{i} = \hat{j} \times \hat{j} = \hat{k} \times \hat{k} = \text{Zero}$$

$$\text{and } \hat{i} \times \hat{j} = \hat{k}, \quad \hat{j} \times \hat{i} = -\hat{k}$$

$$\hat{j} \times \hat{k} = \hat{i} \quad \hat{k} \times \hat{j} = -\hat{i}$$

$$\hat{k} \times \hat{i} = \hat{j} \quad \hat{i} \times \hat{k} = -\hat{j}$$

Putting these values in above equation we get

$$\begin{aligned}\vec{\tau} &= -21(0) + 7(\hat{k}) + 35(-\hat{j}) - 9(-\hat{k}) + 3(0) \\ &\quad + 15(\hat{i}) - 3(\hat{j}) + (-\hat{i}) + 5(0).\end{aligned}$$

$\vec{\tau} = 14\hat{i} - 38\hat{j} + 16\hat{k} \text{ (Nm)}$

Answer

P. 2.13 :- The line of action of force $\vec{F} = \hat{i} - 2\hat{j}$ passes through the point whose position vector is $(-\hat{j} + \hat{k})$. Find

- (a) - the moment of \vec{F} about the origin.
- (b) - the moment of \vec{F} about the point of which the position vector is $(\hat{i} + \hat{k})$.

SOLUTION:-

$$\vec{F} = \hat{i} - 2\hat{j}$$

$$\vec{r} = -\hat{j} + \hat{k}$$

(a) Moment of force about origin

$$= \vec{r} = ?$$

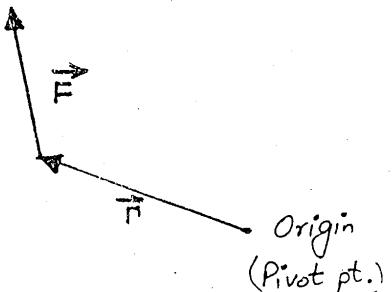

$$\vec{r} = \vec{r} \times \vec{F}$$

$$= (-\hat{j} + \hat{k}) \times (\hat{i} - 2\hat{j})$$

$$= -(\hat{j} \times \hat{i}) + 2(\hat{j} \times \hat{j}) + (\hat{k} \times \hat{i}) - 2(\hat{k} \times \hat{j})$$

$$= -(-\hat{k}) + 2(0) + \hat{j} - 2(-\hat{i})$$

$$\boxed{\vec{r} = 2\hat{i} + \hat{j} + \hat{k}}$$

Answer

(b) In this case

$$\vec{r}_1 = \hat{i} + \hat{k}$$

$$\vec{r}_2 = -\hat{j} + \hat{k}$$

Pivot pt. is 'A' so we have to find out the position vector of force point w.r.t. pivot pt. 'A'.

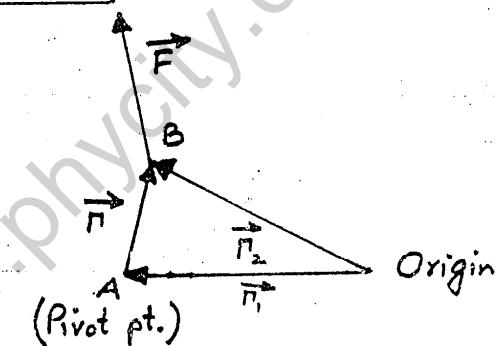

From figure

$$\begin{aligned} \vec{r}_1 + \vec{r} &= \vec{r}_2 && \text{By head to tail rule} \\ \vec{r} &= \vec{r}_2 - \vec{r}_1 \\ &= (-\hat{j} + \hat{k}) - (\hat{i} + \hat{k}) \\ &= -\hat{j} + \hat{k} - \hat{i} - \hat{k} \end{aligned}$$

$$\vec{r} = -\hat{i} - \hat{j}$$

∴ The moment of force about point 'A' is

$$\begin{aligned} \vec{r}' &= \vec{r} \times \vec{F} \\ &= (-\hat{i} - \hat{j}) \times (\hat{i} - 2\hat{j}) \\ &= -(\hat{i} \times \hat{i}) + 2(\hat{i} \times \hat{j}) - (\hat{j} \times \hat{i}) \\ &\quad + 2(\hat{j} \times \hat{j}) \\ &= -0 + 2\hat{k} - (-\hat{k}) + 2(0) \\ \boxed{\vec{r}' = 3\hat{k}} \end{aligned}$$

P-2.14 Q- The magnitude of dot and cross products of two vectors are $6\sqrt{3}$ and 6 respectively. Find the angle between the vectors.

SOLUTION: Let \vec{A} and \vec{B} be the two vectors.

$$\text{Dot Product} = \vec{A} \cdot \vec{B} = 6\sqrt{3}$$

$$\text{Cross Product} = \vec{A} \times \vec{B} = 6$$

The angle between them $= \alpha = ?$
As we have

$$\vec{A} \cdot \vec{B} = AB \cos \alpha \quad \text{--- (1)}$$

$$\vec{A} \times \vec{B} = AB \sin \alpha \hat{n} \quad \text{--- (2)}$$

Squaring equation (1) we get

$$(\vec{A} \cdot \vec{B})^2 = (AB \cos \alpha)^2$$

$$(\vec{A} \cdot \vec{B})^2 = A^2 B^2 \cos^2 \alpha \quad \text{--- (3)}$$

Now squaring eq. (2)

$$(|\vec{A} \times \vec{B}|)^2 = (\vec{A} \times \vec{B})^2 = (\vec{A} \times \vec{B}) \cdot (\vec{A} \times \vec{B})$$

$$(\vec{A} \times \vec{B})^2 = (AB \sin \alpha \hat{n}) \cdot (AB \sin \alpha \hat{n})$$

$$= A^2 B^2 \sin^2 \alpha (\hat{n}) \cdot (\hat{n})$$

$$= A^2 B^2 \sin^2 \alpha (\hat{n} \cdot \hat{n}) \quad (\because \hat{n}^2 = \hat{n} \cdot \hat{n})$$

$$(\vec{A} \times \vec{B})^2 = A^2 B^2 \sin^2 \alpha (1, 1, \cos \alpha)$$

$$(\vec{A} \times \vec{B})^2 = A^2 B^2 \sin^2 \alpha \quad \text{--- (4)}$$

Adding eq (3) and (4) we get

$$(\vec{A} \cdot \vec{B})^2 + (\vec{A} \times \vec{B})^2 = A^2 B^2 \cos^2 \alpha + A^2 B^2 \sin^2 \alpha$$

$$= A^2 B^2 (\cos^2 \alpha + \sin^2 \alpha)$$

$$= A^2 B^2$$

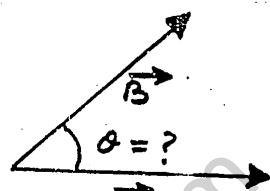

Taking square root on both the sides.

$$AB = \sqrt{(\vec{A} \cdot \vec{B})^2 + (\vec{A} \times \vec{B})^2}$$

$$= \sqrt{(6\sqrt{3})^2 + (6)^2}$$

$$= \sqrt{(36 \times 3) + 36} = \sqrt{108 + 36}$$

$$AB = \sqrt{144} = 12$$

Now $\vec{A} \cdot \vec{B} = AB \cos \alpha$ (73)

$$\cos \alpha = \frac{\vec{A} \cdot \vec{B}}{AB} = \frac{6\sqrt{3}}{12} = \frac{\sqrt{3}}{2}$$

$$\alpha = \cos^{-1}\left(\frac{\sqrt{3}}{2}\right)$$

$\alpha = 30^\circ$

Answer.

Q 2.15: A load of $10N$ is suspended from a clothes line. This distorts the line so that it makes an angle of 15° with the horizontal at each end. Find the tension in the clothes line.

SOLUTION:

$$\text{Load} = W = 10N$$

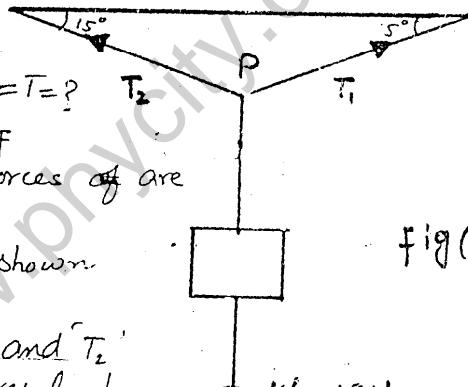

$$\text{Angle} = \alpha = 15^\circ$$

$$\text{Tension in the clothesline} = T = ?$$

For using condition of equilibrium, all the forces off are acting on point 'P'.

The force diagram is shown in figure (a).

The inclined forces T_1 and T_2 can now be easily resolved along x and y -axis as shown in fig (b).

fig(a)

Applying

$$\sum F_x = 0$$

$$T_1 \cos 15^\circ - T_2 \cos 15^\circ = 0$$

$$T_1 \cos 15^\circ = T_2 \cos 15^\circ$$

$$T_1 = T_2 = T \text{ (let)}$$

Now applying

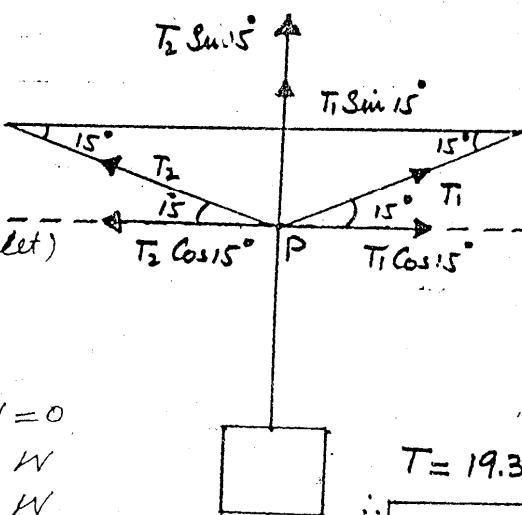

$$\sum F_y = 0$$

$$T_1 \sin 15^\circ + T_2 \sin 15^\circ - W = 0$$

$$T \sin 15^\circ + T \sin 15^\circ = W$$

$$2T \sin 15^\circ = W$$

$$T = \frac{W}{2 \sin 15^\circ} = \frac{10}{2(0.25)} = 20N$$

$$T = 19.3N$$

$$\therefore T_1 = T_2 = 19.3N$$

2.16. A tractor of weight 15,000 N crosses a single span bridge of weight 8000 N and of length 21.0 m. The bridge span is supported half a metre from either end. Tractor's front wheels take $\frac{1}{3}$ of the total weight of the tractor, and the rear wheels are 3 m behind the front wheels. Calculate the force on the bridge supports when the rear wheels are at the middle of the bridge span.

SOLUTION:-

Weight of tractor

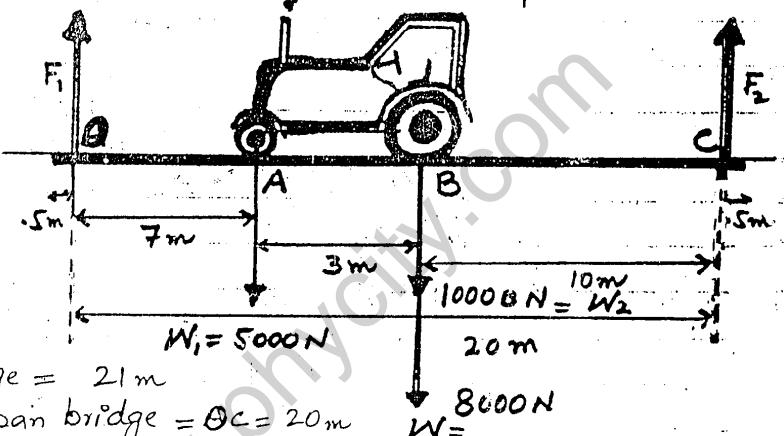

$$W' = 15,000 \text{ N}$$

Weight of bridge

$$W = 8000 \text{ N}$$

Length of bridge = 21 m

Length of the span bridge = OC = 20 m

$$\begin{aligned} \text{Weight of front wheel of the tractor } W_1 &= \frac{1}{3} \times W' \\ &= \frac{1}{3} \times 15000 \\ &= 5000 \text{ N} \end{aligned}$$

$$\begin{aligned} \text{Weight of rear wheel of the tractor } W_2 &= W' - W_1 \\ &= 15000 - 5000 \\ &= 10,000 \text{ N} \end{aligned}$$

Distance between two wheels = AB = 3 m

Forces on the bridge supports = $F_1 = ?$

$$F_2 = ?$$

When the rear wheel of the tractor is in middle of the span bridge So

According to figure

and

$$BC = 10 \text{ m}$$

$$AB = 3 \text{ m}$$

$$OA = 7 \text{ m}$$

Now applying first condition of equilibrium

$$\sum F_x = 0$$

$$\text{and } \sum F_y = 0$$

As there is no force acting along x-axis so apply

$$\sum F_y = 0$$

$$F_1 + F_2 - W_1 - W_2 - W = 0$$

$$F_1 + F_2 - 5000 - 10,000 - 8000 = 0$$

$$F_1 + F_2 = 23,000 \text{ N} \quad \text{①}$$

Now applying second condition of equilibrium
 $\sum T = 0$

Take 'O' as pivot point.

$$\therefore \text{Moment arm of } F_1 = 0$$

$$\text{Moment arm of } F_2 = OC$$

Using

$$T = (\text{Force})(\text{Moment arm})$$

$$F_1(0) + F_2(OC) - W_1(OA) - W_2(OB) - W(OB) = 0$$

$$F_1(0) + F_2(20) - 5000(7) - 10000(10) - 8000(10) = 0$$

$$20F_2 - 35000 - 100000 - 80000 = 0$$

$$20F_2 = 215000 \text{ N}$$

$$F_2 = \frac{215000}{20}$$

$$F_2 = 10750 \text{ N} = 10.750 \times 10^3 \text{ N}$$

$$F_2 = 10.75 \text{ KN} \quad \text{Answer}$$

Putting this value in eq. ①

$$F_1 = 23000 - F_2$$

$$= 23000 - 10750$$

$$F_1 = 12250 \text{ N} = 12.250 \times 10^3 \text{ N}$$

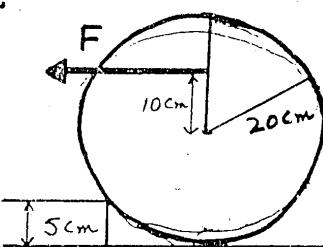

$$F_1 = 12.25 \text{ KN}$$

Answer

P. 2.17 :- A spherical ball of weight 50N is to be lifted over the step as shown in fig.

- (a) Calculate the minimum force needed just to lift it above the floor.

- (b) Determine the force acting on the ball at that instant.

SOLUTION :-

Weight of the spherical ball

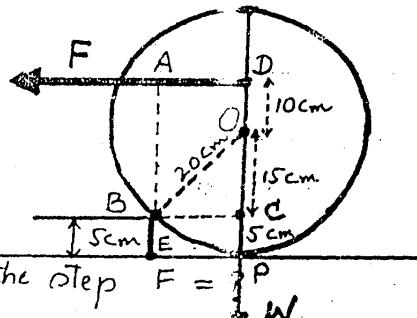

$$W = 50 \text{ N}$$

The curb height $h = 5 \text{ cm}$

Radius of ball $= r = 20 \text{ cm}$

(a) Minimum force needed to lift over the step $F = ?$

As from figure

$$BE = h = 5 \text{ cm} = CP$$

$$\text{Radius } OB = r = OP = 20 \text{ cm}$$

and

$$OC = 15 \text{ cm} \quad (\because OC = OP - PC)$$

$$OD = 10 \text{ cm}$$

and

$$DC = OC + OD = 15 + 10 \\ = 25 \text{ cm}$$

As from Figure

From rt $\triangle OBC$

By Pythagorean's theorem

$$(OP)^2 = (BC)^2 + (OC)^2$$

$$(BC)^2 = (OB)^2 - (OC)^2$$

$$(BC)^2 = (20)^2 - (15)^2$$

$$BC = \sqrt{400 - 225} = \sqrt{175} = 13.2 \text{ cm}$$

Now taking 'B' as pivot pt.

$$\sum T_B = 0$$

Using
Torque = (Force)(Moment arm)

$$F(AB) - W(BC) = 0$$

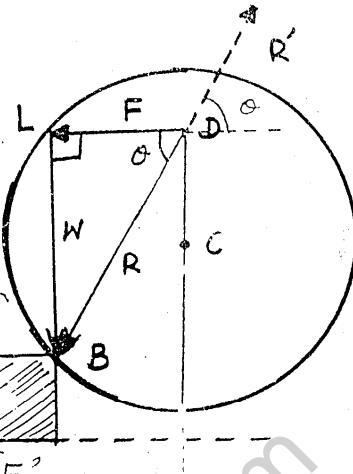

$$F(25) - 50(13.2) = 0$$

$$F = \frac{50 \times 13.2}{25}$$

$$= 26.4 \text{ N}$$

$F \approx 26 \text{ N}$

Answer.

(b) - Our requirement is to calculate the resultant force 'R'. Let R' be its reactional force. In this case weight of the ball will act at point B. Two forces are acting on this ball weight and applied force 'F'.

By head-to-tail rule it can be seen that \vec{R} is the resultant force. i.e.

$$\vec{R} = \vec{F} + \vec{W}$$

From figure we have

$$LD = F = 26\text{ N}$$

$$LB = W = 50\text{ N}$$

$$BD = R = ?$$

So applying Pythagorean theorem on rt \triangle DLB

$$(ED)^2 = (LD)^2 + (LB)^2$$

$$R^2 = (F)^2 + (W)^2$$

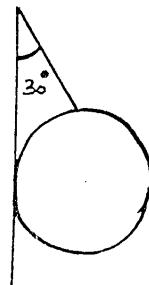

$$R = \sqrt{F^2 + W^2} = \sqrt{(26)^2 + (50)^2}$$

$$R = 56.3\text{ N}$$

$$R \approx 56\text{ N}$$

P. 2.18 :- A uniform sphere of weight 10N is held by a string attached to a frictionless wall so that the string makes an angle of 30° with the wall as shown in fig.

Find the tension in the string and the force exerted on the sphere by the wall.

Solution:

$$\text{Weight of sphere} = W = 10 \text{ N}$$

$$\angle OBA = 30^\circ$$

Tension in the string = $T = ?$

Force exerted by wall on sphere = $F = ?$

Now consider rt $\triangle OAB$

$$\angle OAB + \angle OBA + \angle AOB = 180^\circ$$

$$90^\circ + 30^\circ + \angle AOB = 180^\circ$$

$$\therefore \angle AOB = \theta = 180^\circ - 120^\circ = 60^\circ$$

Now resolving Tension into its rectangular components.
There are four forces are acting.

Two are $T \cos 60^\circ$ and its reactional force F along x -axis, while other two ' $T \sin 60^\circ$ ' and weight along y -axis.

Now applying first condition of equilibrium

$$\sum F_x = 0$$

$$F - T \cos 60^\circ = 0$$

$$F = T \cos 60^\circ \quad \text{--- } ①$$

Also

$$\sum F_y = 0$$

$$T \sin 60^\circ - W = 0$$

$$T \sin 60^\circ = W$$

$$T = \frac{W}{\sin 60^\circ} = \frac{10 \text{ N}}{\sin 60^\circ}$$

$T = 11.5 \text{ N}$

Answer

Putting this value in eq ① we get

$$F = (11.5 \text{ N}) \cos 60^\circ$$

\therefore

$F = 5.77 \text{ N}$

Answer

This is the force exerted by wall on the sphere.
