

PROBLEMS

P. 6.1 :- Certain globular protein particle has a density of 1246 kg m^{-3} . It falls through pure water ($\eta = 8.0 \times 10^{-4} \text{ N m s}^{-2}$) with a terminal speed of 3.0 cm h^{-1} . Find the radius of particle.

Solution :-

Data :-

Density of protein particle =

$$\rho = 1246 \text{ kg m}^{-3}$$

Coefficient of viscosity of water

$$\eta = 8.0 \times 10^{-4} \text{ N m s}^{-2}$$

$$= 8.0 \times 10^{-4}$$

$$v_t = 3 \text{ cm h}^{-1} = \frac{3 \times 10^{-2}}{3600} \text{ m s}^{-1}$$

$$v_t = 8.33 \times 10^{-6} \text{ m s}^{-1}$$

Radius $r = ?$

Calculations

As we have

$$v_t = \frac{2gr^2\rho}{9\eta}$$

$$r^2 = \frac{9\eta V_t}{2g\rho}$$

$$r^2 = \frac{9 \times 8 \times 10^{-4} \text{ Nm s}^{-2} \times 8.33 \times 10^{-6} \text{ m s}^{-1}}{2 \times 9.8 \text{ m s}^{-2} \times 1246 \text{ Kg m}^{-3}}$$

$$r = \sqrt{25 \times 10^{-10}} \text{ m}$$

$$r = 5 \times 10^{-5} \text{ m}$$

Answer.

P. 6.2 :- Water flows through a hose, whose internal diameter is 1cm, at a speed of 1m s⁻¹. What should be the diameter of the nozzle if the water is to emerge at 21m s⁻¹?

Solution

Data :- $d_1 = 1 \text{ cm} = 10^{-2} \text{ m}$

Speed of water flow $v_1 = 1 \text{ m s}^{-1}$

Speed of water emergence $v_2 = 21 \text{ m s}^{-1}$

Diameter of the nozzle = $d_2 = ?$

Calculation :-

According to equation of continuity

$$A_1 v_1 = A_2 v_2 \quad \text{--- (1)}$$

where

$$A = \pi r^2$$

So

$$A_1 = \pi r_1^2 = \pi \left(\frac{d_1}{2}\right)^2 \quad (\because d = 2r)$$

$$A_1 = \frac{\pi d_1^2}{4}$$

Similarly

$$A_2 = \frac{\pi d_2^2}{4}$$

Putting in eq (1)

$$\frac{\pi d_1^2}{4} v_1 = \frac{\pi d_2^2}{4} v_2$$

$$\frac{d_1^2 v_1}{d_2^2 v_2} = 1$$

$$d_2^2 = \frac{d_1^2 v_1}{v_2}$$

$$d_2 = \sqrt{\frac{v_1 d_1^2}{v_2}}$$

$$= \sqrt{\frac{1}{21} \times (0.01)^2} = \sqrt{0.05} \times (0.01)$$

$$= 0.002 \text{ meters}$$

$$\boxed{d_2 = 0.2 \text{ cm}} \quad \text{Answer}$$

P. 6.3 :- The pipe near the lower end of a large water storage tank develops a small leak and a stream of water shoots from it. The top of water in the tank is 15 m above the point of leak.

(a). With what speed does the water rush from the hole?

(b). If the hole has an area of 0.060 cm^2 , how much water flows out in one second?

SOLUTION :-

Data :- Height of water = $\Delta h = 15 \text{ m}$
Area of hole = $A = 0.06 \text{ cm}^2$

Speed of water emergence = $v = ?$

Rate of water emergence = $R = ?$

Calculations :-

(a). According to Torricelli's theorem

$$v = \sqrt{2g \Delta h}$$

$$= \sqrt{2 \times 9.8 \times 15} \text{ m s}^{-1}$$

$$\boxed{v = 17.14 \text{ m s}^{-1}} \quad \text{Answer}$$

(b). From equation of continuity
Volume flow rate = $A v$

$$v = 17.14 \text{ m s}^{-1} = 1714 \text{ cm s}^{-1}$$

$$\text{Volume flow rate} = 1714 \text{ cm s}^{-1} \times 0.06 \text{ cm}^2$$

$$= 102 \text{ cm}^3 \text{ s}^{-1}$$

So volume of water flows out in one second

$V = 102 \text{ cm}^3$	Answer
------------------------	--------

P. 6.4 ∴ Water is flowing smoothly through a closed pipe system. At one point the speed of water is 3 m s^{-1} , while at another point 3 m higher, the speed is 4.0 m s^{-1} . If the pressure is 80 kPa at the lower point, what is pressure at the upper point?

Solution:-

Data:-

speed of water on lower end
 $= v_1 = 3 \text{ m s}^{-1}$

speed of water on upper end $v_2 = 4 \text{ m s}^{-1}$

pressure at lower end $= P_1$

$= 80 \text{ kPa} = 80 \times 10^3 \text{ Pa} = 80 \times 10^3 \text{ N m}^{-2}$

pressure at upper end $P_2 = ?$

Height of water $\Delta h = h_2 - h_1 = h_1 - h_2 = 3 \text{ m}$

Calculations:-

According to Bernoulli's equation.

$$P_1 + \frac{1}{2} \rho v_1^2 + \rho g h_1 = P_2 + \frac{1}{2} \rho v_2^2 + \rho g h_2$$

or

$$P_2 = P_1 + \frac{1}{2} \rho (v_1^2 - v_2^2) + \rho g (h_1 - h_2)$$

$$= 80000 + \frac{1}{2} \times 10^3 (3^2 - 4^2) + (1000 \times 9.8 \times 3)$$

$$= 47100 \text{ Pa}$$

$$= 47.100 \times 10^3 \text{ Pa}$$

$P_2 = 47 \text{ kPa}$	Answer
------------------------	--------

P. 6.5:- An aeroplane wing is designed so that when the speed of the air across the top of the wing is 450 m s^{-1} , the speed of air below the wing is 410 m s^{-1} . What is the pressure difference between the top and bottom of the wings?

SOLUTION:-

DATA:-

$$\text{Speed of air on top} = v_1 = 450 \text{ m s}^{-1}$$

$$\text{Speed of air below} = v_2 = 410 \text{ m s}^{-1}$$

$$\text{Density of air} = \rho = 1.29 \text{ kg m}^{-3}$$

$$\text{Difference in pressure} = \Delta P = ?$$

CALCULATION:-

According to Venturi relation.

$$P_2 - P_1 = \frac{1}{2} \rho (v_1^2 - v_2^2)$$

$$\Delta P = \frac{1}{2} \rho (v_1^2 - v_2^2)$$

$$= \frac{1}{2} \times 1.29 \{ (450)^2 - (410)^2 \}$$

$$= \frac{1}{2} \times 1.29 \times 34400$$

$$= 22188 \text{ Pa}$$

$$\Delta P = 22.188 \times 10^3 \text{ Pa}$$

$$\Delta P = 22 \text{ kPa}$$

Answer

P. 6.6:- The radius of the aorta is about 1.0 cm and the blood flowing through it has a speed of about 30 cm s^{-1} . Calculate the average speed of the blood in the capillaries using the fact that although each capillary has a diameter of about $8 \times 10^{-4} \text{ cm}$, there are literally millions of them so that their total cross section is about 2000 cm^2 .

Data :- Radius of aorta = $r_1 = 1 \text{ cm}$
 Speed of blood = $v_1 = 30 \text{ cm s}^{-1}$
 Diameter of capillary = $d = 8 \times 10^{-4} \text{ cm}$
 Radius of = $r = 4 \times 10^{-4} \text{ cm}$
 Total area of cross section of capillaries
 = $A_2 = 2000 \text{ cm}^2$
 Average speed of blood = $v_2 = ?$

CALCULATIONS :-

$$\begin{aligned} \text{Area of aorta} = A_1 &= \pi r_1^2 \\ &= 3.14 \times (1 \text{ cm})^2 \\ &= 3.14 \text{ cm}^2 \end{aligned}$$

From equation of continuity

$$A_1 v_1 = A_2 v_2$$

$$\begin{aligned} v_2 &= \frac{A_1 v_1}{A_2} \\ &= \frac{3.14 \text{ cm}^2 \times 30 \text{ cm s}^{-1}}{2000 \text{ cm}^2} \\ &= 4.7 \times 10^{-2} \text{ cm s}^{-1} \\ &= 4.7 \times 10^{-4} \text{ m s}^{-1} \end{aligned}$$

$$\boxed{v_2 = 5 \times 10^{-4} \text{ m s}^{-1}} \quad \text{Answer}$$

P- 6.7 :- How large must a heating duct be if air moving 3.0 m s^{-1} along it can replenish the air in a room of 300 m^3 volume every 15 min? Assume the air's density remains constant.

SOLUTION :-

Data :-

$$\text{Speed of air} = v = 3 \text{ m s}^{-1}$$

$$\text{Volume of air} = V = 300 \text{ m}^3$$

$$\text{Time} = t = 15 \text{ min} = 15 \times 60 = 900 \text{ sec}$$

$$\text{Size of duct} = r = ?$$

CALCULATIONS :.

According to Equation of Continuity

$$Av = \text{Volume flow rate}$$

$$Av = \frac{V}{t}$$

$$\pi r^2 v = \frac{V}{t} \quad (\because A = \pi r^2)$$

$$r^2 = \frac{V}{\pi vt}$$

$$r = \sqrt{\frac{V}{\pi vt}} = \sqrt{\frac{300 \text{ m}^3}{3.14 \times 3 \text{ m/s} \times 900 \text{ s}}}$$

$$\boxed{r = 0.19 \text{ m} = 19 \text{ cm}}$$

P. 6.8 :. An airplane design calls for a "lift" due to the net force of the moving air on the wing of about 1000 N/m^2 of wing area.

Assume that air flows past the wing of an aircraft with streamline flow. If the speed of flow past the lower wing surface is 160 m/s what is the required speed over the upper surface to give a lift of 1000 N/m^2 ? The density of air is 1.29 kg/m^3 and assume max. thickness of wing be one meter

SOLUTION :

Data :- Pressure on wing $\Delta P = 1000 \text{ N/m}^2$

Speed of air $= v_1 = 160 \text{ m/s}$

Density of air $= \rho = 1.29 \text{ kg/m}^3$

Thickness of wing $= 1 \text{ m}$

Speed of uplift $= v_2 = ?$

Calculation :-

According to Venturi relation

$$P_1 - P_2 = \frac{1}{2} \rho (v_2^2 - v_1^2)$$

$$\Delta P = \frac{1}{2} \rho (v_2^2 - v_1^2)$$

$$v_2 = \sqrt{\frac{2\Delta P}{\rho} + v_1^2}$$

$$v_2^2 = \frac{2 \times 1000 \text{ Nm}^{-2}}{1.29 \text{ kg m}^{-3}} + (160 \text{ m s}^{-1})^2$$

$$v_2 = \sqrt{\frac{2000}{1.29} \text{ m}^2 \text{ s}^{-2} + (160)^2 \text{ m}^2 \text{ s}^{-2}}$$

$$v_2 = 164.77 \text{ m s}^{-1}$$

$v_2 = 165 \text{ m s}^{-1}$

Answer

P. 6.9 ∴ What gauge pressure is required in the city mains for a stream from a fire hose connected to the mains to reach a vertical height of 15 m ?

SOLUTION :-

Data ∴ $\Delta h = 15 \text{ m}$
 $g = 9.8 \text{ m s}^{-2}$
 Density of water $\rho = 1000 \text{ kg m}^{-3}$
 $\Delta P = ?$

Calculations :-

According to Bernoulli's equation
 $P_1 + \frac{1}{2}\rho v_1^2 + \rho gh = P_2 + \frac{1}{2}\rho v_2^2 + \rho gh_2$

or $P_1 - P_2 = \rho g(h_2 - h_1) + \frac{1}{2}\rho(v_2^2 - v_1^2)$
 As speed of water throughout the flow does not change so $v_1 = v_2 \Rightarrow v_2^2 - v_1^2 = 0$

So

$$\Delta P = \rho g(h_2 - h_1) = \rho g \Delta h$$

$$\Delta P = 1000 \times 9.8 \times 15 \text{ Nm}^{-2}$$

$\Delta P = 1.47 \times 10^5 \text{ Pa}$

Answer
